

PHYSICAL COMPUTING

WEEK 02

a word about

TESTING AND DEBUGGING

WHEN TO EMAIL ME

1. Did you run a google search and read the results?
2. Did you ask your friends in class?
3. Did you post on the student forums?
4. Did you search the arduino forums? <http://forum.arduino.cc/>
5. Did you post to the arduino forums and give it a few hours?
5. Did you walk away from the problem then try again it?
Still stuck? Email.

If I can find your problem on the first page of google, I'm not going to reply. Not because I don't like you but because this is poor, poor dev practice.

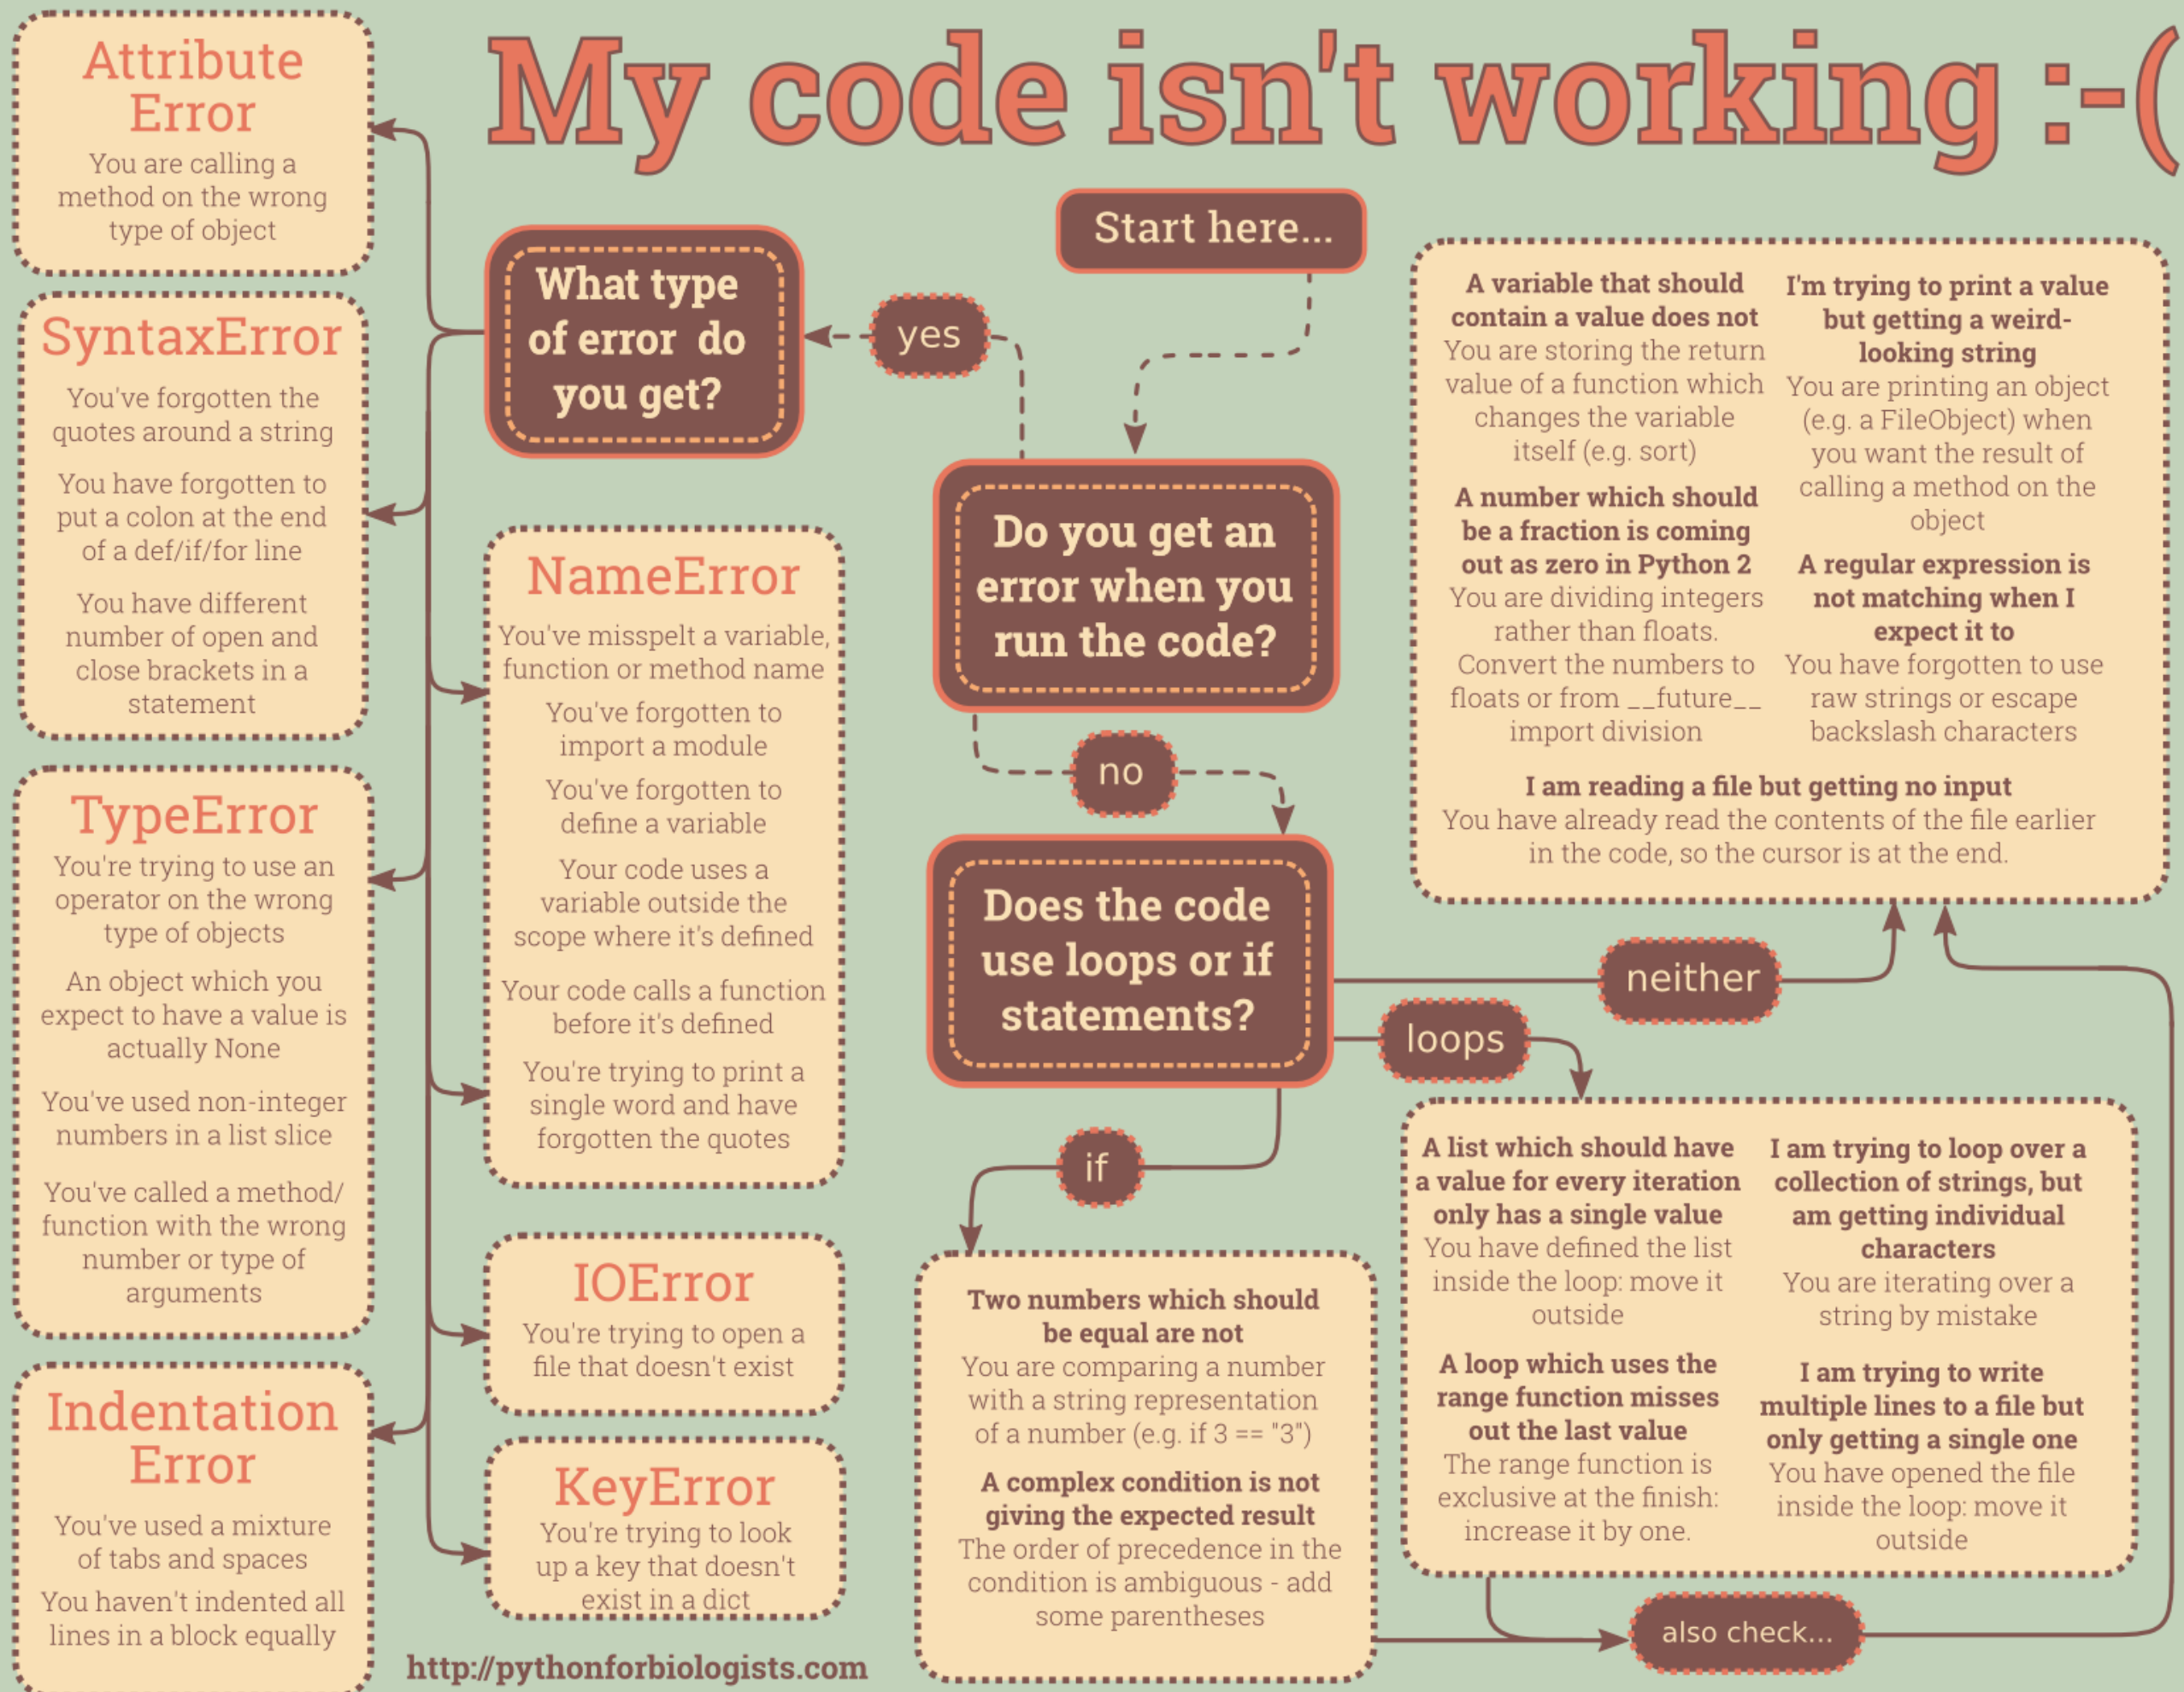

**IF YOU LEARN ONLY ONE SKILL IN COLLEGE,
LEARN TO FIND YOUR OWN ANSWERS THROUGH DEBUGGING.**

99 little bugs in the code.
99 little bugs in the code.
Take one down, patch it around.

127 little bugs in the code...

My code isn't working :-)

Sensors and actuators

INPUT AND OUTPUT

<https://www.youtube.com/watch?v=m6kJsdkZEIQ>

BUTTONS

Poles - primary contact

Throws - number of switches active at a given time

1p1t
on

2p2t

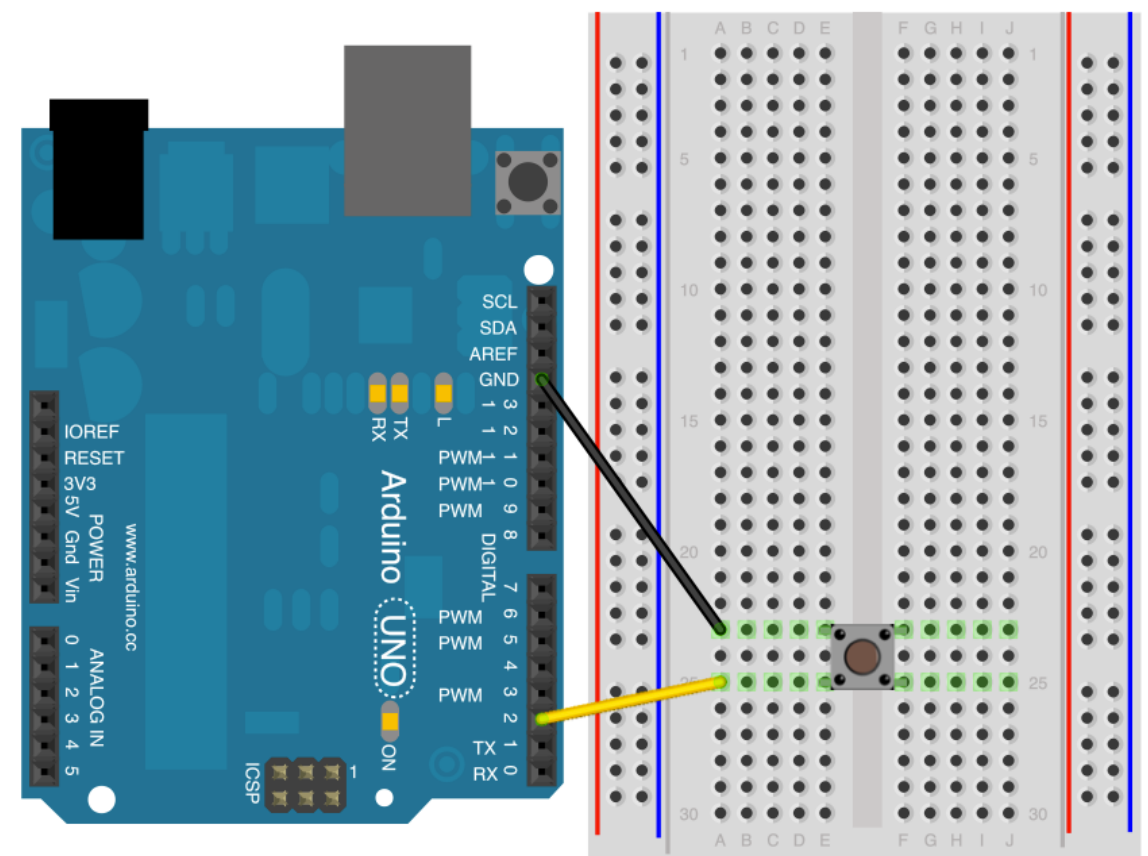

2p1t
on or off

And so on...

THE PUSH BUTTON

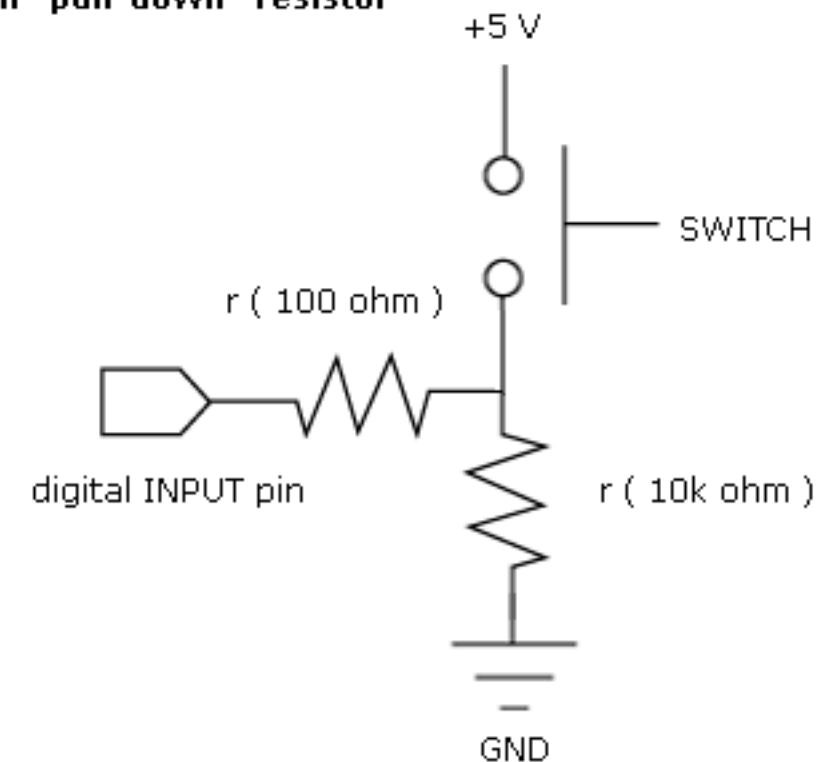

a single pushbutton may close or open two separate pairs of contacts

Current flows down the
path of least resistance

Switch with "pull-down" resistor

Switch with "pull-up" resistor

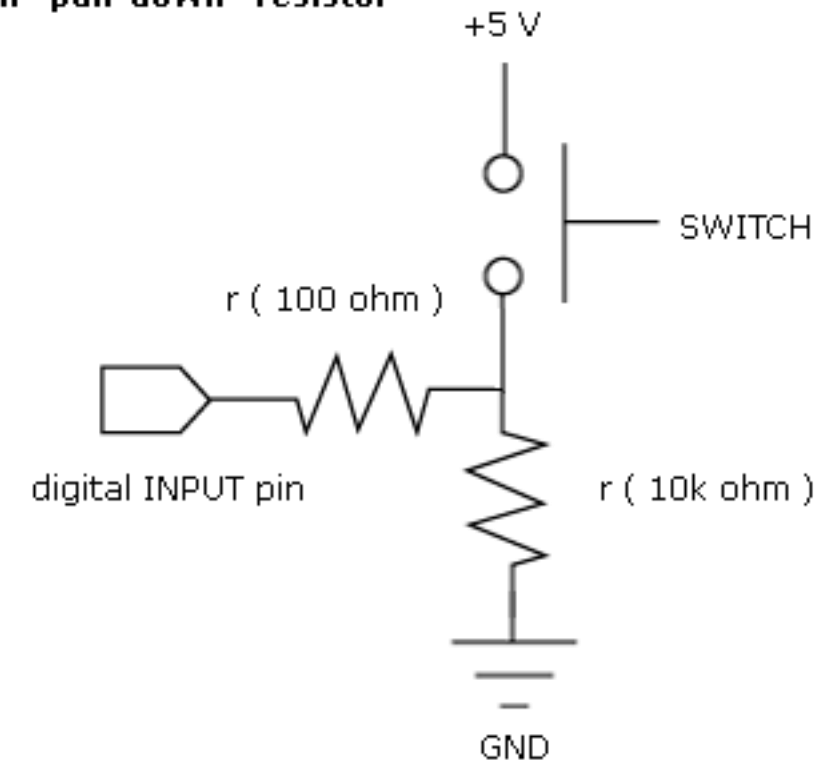

digitalRead(pinNumber)

use this function to measure
a closed (or open) connection

Switch with "pull-down" resistor

Switch with "pull-up" resistor

THE POTENTIOMETER

A variable resistor

fritzing

potentiometer

ALL YOU NEED IS A WAY TO MEASURE THAT CHANGE
**AND THAT'S WHAT YOU CAN DO WITH A MICRO
CONTROLLER.**

analogRead(pinNumber)

use this function to measure resistance

fritzing

THE SLIDER

A sideways potentiometer

There are many different kinds of sensors

ir

light

sonar (proximity)

sound

touch

bend

mostly they change
resistance in some way

THE LDR

A variable resistor

Some examples of sensors in the world

<https://vimeo.com/105146759>

Interaction breakdown:

When the dancer bends her arm,
trigger a motor to hit the instrument with a mallet.

<https://www.youtube.com/watch?v=OtKf9C0s6p8#t=30>

1. A motor for each mallet hooked up to a circuit and your Arduino
2. A bend sensor MAPPED to trigger the mallet using the code in the Arduino IDE
3. input is mapped to output

What is a multimeter?

SERIAL DATA

This is kind of line `println()` in processing in that it lets you print out values

But totally different in that it's actually a data sending protocol. Things happen one bit at a time.

More detail here: <http://www.ladyada.net/learn/arduino/lesson4.html>

I like to think of it like shipping. It ships data to a port on your computer other applications can go to and there they can receive that data.

You call `Serial.begin(baudrate)` in `setup()` and then you can call `Serial.write(value)` in the `loop()`

SERIAL DATA

You'll always want to check to see if you have any data available **BEFORE** you start reading it or you can crash your computer
